

# Head UI Billboard

## Overview

A lightweight health bar rendered directly in world space — no Canvas, no UI Camera, no texture needed. Everything is drawn by a single custom shader using pure math, keeping it highly performant even with many instances. The bar always faces the camera and maintains a consistent screen size at any distance. Supports occlusion control, so you can choose whether the bar renders through walls or gets hidden behind geometry naturally. Fully compatible with Built-in, URP, and HDRP.

Originally created for personal game development projects and later prepared for public release.

## Notes

- An example scene is included with everything set up — just open it, press Play, and use 1 to damage and 2 to heal.
- A fly camera is included for the example scene — move with WASD, up/down with Q/E, hold Shift to speed up, and right-click drag to rotate.
- Name tag text uses TextMeshPro — ensure the TextMeshPro package is imported.
- Input uses the old Unity Input System — ensure it is enabled in Project Settings.
- Only Unity 6 has been officially tested, but earlier versions should work.
