

Optimization Tools

Overview

This is an all-in-one Editor extension with eight optimization utilities under a single tabbed hub window. Each tool can also be opened standalone. No runtime dependencies — everything runs inside the Unity Editor and is fully stripped from builds.

Included Tools

Mesh Combiner — Combines static meshes into one, with optional texture atlas and duplicate vertex removal.

Skinned Mesh Combiner — Merges SkinnedMeshRenderers sharing a rig. Handles bone remapping and atlas generation.

Mesh Simplifier — Reduces polygon count via decimation. Preview button lets you inspect the result before saving.

Texture Simplifier — Batch-resizes textures to a target resolution. Supports individual textures or a full folder.

UV Atlas Mapper — Packs textures into one atlas and remaps UVs per-object without merging meshes.

LOD Generator — Auto-generates a LODGroup with three detail levels from any mesh.

Missing Scripts Cleaner — Scans scene GameObjects for missing components, lists them, then removes in one click.

Canvas Analyzer — Counts Graphic components on a Canvas and advises whether it is safe for frequent updates.

Quick Start

Go to **Tools > Nikson > Optimization** to open the hub window.

Select any tab to switch between tools. All settings are saved between sessions.

Assign a target GameObject, configure options, and click **Generate**.

Notes

Generated assets are saved to *Assets/Nikson/Optimization/Generated/* by default. Path is configurable per tool.

If a file already exists, a number is appended automatically so nothing is ever overwritten.

All operations support Undo where applicable.

The package is fully editor-only and does not affect builds.

May also work on earlier Unity versions, but only Unity 6 has been officially tested.
